

A Research & Education community solution to commercial student validation

InAcademia enables commercial service providers to validate academic affiliation instantly, securely and reliably

End users are able to access the services they want without the need to divulge more personal data than is strictly necessary

Our model helps recover some of the profit that commercial providers generate from using federated identities, instead using it to support the development of federated identity services.

How it works

InAcademia provides a simple OIDC gateway to the federated academic identity infrastructure, via eduGAIN, meaning that services onboard only once and require less support from institutions.

The service provider redirects the student via our API, the student is validated by their home institution and the pseudonymised result is returned back to the service provider's site.

InAcademia provides secure, privacy preserving validation
Helps to minimise release of personal data

Leveraging eduGAIN
Used and trusted by thousands of institutions worldwide

Part of the R&E community
Supported by a committee of national federation representatives
